### **2) Research Activity**

BB's research interests cover the intersection of two broad, generally poorly-linked areas, known as "Materials for Electrochemical Energetics" and "*operando* Spectroelectrochemistry". These concern, on the one hand pushing our capabilities to fabricate functional materials for novel electrical energy storage systems, and on the other hand gaining a molecular-level understanding of the processes underlying the operation and durability of the different active components of devices such as batteries, fuel cells and supercapacitors.

Additional research topics he covers, include the development of microspectroscopic methods and electrochemical devices for specialized spectroscopic studies and the mathematical modelling of electrochemical phase-formation processes. As detailed below, it is worth noting here that BB developed a range of original *operando* linear and non-linear spectroelectrochemical and microspectroelectrochemical approaches, regarding both the wavelength range from IR to soft X-rays, and its related theoretical framework, to follow out-of-equilibrium electrochemical reacting interfaces with active phase-formation processes. This approach provides a unique way of gaining access to the dynamics of battery components as they behave in real life. The systems addressed include, in particular, Solid-Oxide Fuel Cells (SOFC<sup>1</sup>), Proton-Exchange Membrane Fuel Cells (PEMFC), Zn-air Batteries (ZAB) and Fuel Cells (ZAFC), but the methodology can be extended to all types of batteries.

BB has published **276 scientific papers** in renowned International journals of relatively high impact, including, *inter alia*: Analytical Chemistry, ACS Applied Materials & Interfaces, ChemElectroChem, ChemSusChem, Corrosion Science, Electrochemistry Communications, Electrochimica Acta, International Journal of Hydrogen Energy, Journal of Materials Chemistry A,
